PROFESSIONAL SUMMARY

Full-stack engineer who takes ambiguous problems from architecture decision record to production support, including on projects running without product management. At American Express, owns the notification and webhook domain of an **event-driven integration platform** that lets internal product teams connect to third-party financial data providers, spanning Kotlin services on AWS and the React interfaces on top of them. **Six years** across **banking, retail, and fintech**, and ships independently, including a consumer app **live on both the App Store and Google Play**.

TECHNICAL SKILLS

Languages: Kotlin, Java, TypeScript, JavaScript, C#, Python, SQL, HTML5, CSS/SCSS

Backend & APIs: Spring Boot, Spring MVC, Ktor, Micronaut, .NET Core, Node.js, REST API design

System Design: Microservices, event-driven architecture, distributed systems, pub/sub messaging, webhooks, scalability, architecture decision records

Frontend: React, React Native, Vue.js, Angular

Data & Cloud: PostgreSQL (Aurora), MySQL, SQL Server, Redis, MongoDB, BigQuery, Apache Kafka, AWS SNS/SQS, AWS, Azure, Docker, Kubernetes, Terraform, Argo CD, CI/CD, Datadog, Splunk, PagerDuty

AI Engineering: Claude Code, GitHub Copilot, Codex, agentic coding workflows (AGENTS.md), LLM-automated code review, RAG, MCP servers

PROFESSIONAL EXPERIENCE

Engineer II (Contract) | American Express

Dec 2025 - Present

Technologies: Kotlin, Ktor, React, PostgreSQL (Aurora), AWS SNS/SQS, Terraform, Argo CD, Datadog, BigQuery

- **Own the notification and webhook domain end to end** across four services (onboarding, gateway, webhook ingestion, orchestration), letting internal product teams publish and consume business events without building their own third-party financial-data integrations.
- Architected the **event distribution pipeline** in Kotlin and Ktor on AWS SNS/SQS and Aurora PostgreSQL, resolving each event to its owning client, transforming payloads, and delivering real-time notifications to subscriber callback endpoints.
- Authored the architecture decision records that made **event onboarding configuration-driven and subscriptions self-service**, removing a release cycle from every new event and taking the platform team out of the critical path for partner adoption.
- Designed an **event-processing audit store** with month-wise PostgreSQL partitioning (pg_partman, pg_cron) and a BigQuery compliance stream, giving support a queryable failure trail and replay path beyond the 7-day log retention window.
- Extended a React servicing portal with **two new partner-facing modules** for self-service connection management and incident creation via the enterprise incident API, with scoped access identities; shipped a full release where the product team had expected a demo.
- Built the platform's **Datadog alerting and release management** for three core services, and established the team's **AI-assisted development practice**: AGENTS.md conventions, parallel coding agents, and an automated LLM pull-request reviewer.

Senior Software Engineer | Egen

May 2022 - Nov 2025

Technologies: Java, Kotlin, Spring Boot, Spring MVC, Micronaut, Vue.js, Apache Kafka, MySQL, PostgreSQL, Redis, Argo CD, Datadog, Splunk, PagerDuty

- **Promoted to Senior Software Engineer within 15 months**; owned the transportation applications across their Spring MVC and Spring Boot services and Vue.js front ends, and mentored junior developers through design reviews.
- **Re-platformed ZipMove** from a legacy Spring MVC application into a new Spring Boot service with a Vue.js interface, automating a manual workflow so stores transfer orders intact with automatic price-difference reconciliation, **protecting \$50K to \$100K in order value on every transfer** that would otherwise have been lost to cancellation.
- Built the **Kafka-driven order-routing integration** dispatching released orders to external partner Ortec for delivery-window optimization across multiple stores, ensuring orders were scheduled into feasible delivery routes at scale.
- **Improved API efficiency 15%, reduced system load 20%, and lowered error rates 35%** through distributed caching with a fallback strategy; **cut endpoint latency 12%** by eliminating redundant SQL queries.

Software Consultant | BDO Canada

Mar 2021 - May 2022

Technologies: C#, .NET Core, Python, Angular, TypeScript, SQL Server, Azure DevOps, Jenkins

- Delivered secure, scalable web applications for **Canada's largest financial institutions, including TD, RBC, and Scotiabank**, building responsive Angular front ends against C# and .NET Core services; supported the team through code reviews and mentoring junior developers.

Earlier: Programmer Analyst Intern, **Ontario Teachers' Pension Plan** (Jan 2020 - Aug 2020) and part-time Mobile Application Developer, **Bidja Innovations Inc.** (Jan 2019 - Dec 2019), during the Master of Applied Computing program.

PROJECTS

- **SplitNSave (splitnsave.app)**: Cross-platform **React Native** cost-splitting app built end to end with AI coding tools; **live on the App Store and Google Play**.
- **Salon SaaS (in development)**: **React** salon booking platform with public booking links, a **RAG-based chatbot**, **MCP tools** exposing salon data to AI assistants, and an appointment dashboard.

EDUCATION & CERTIFICATIONS

Master of Applied Computing, University of Windsor, Ontario, Canada

Jan 2019 - Aug 2020

Microsoft Certified: Azure Developer Associate (AZ-204), Microsoft, 2023
